## Abstract of JP 11261502 (A)

**PROBLEM TO BE SOLVED:** To selectively store only data that are requested by a receiver, to reduce a storage capacity that is needed for data storage and to easily retrieve stored data. **SOLUTION:** A keyword specifying data content is set in data. A keyword deciding part 20 decides whether or not a desired keyword exists in received data by using a keyword designated by a receiver at the time of receiving the data. As a result, when the desired keyword exists in the data, a flag of '1' is erected and when it does not exist, a flag of '0' is erected. A data restoring part 23 restores the data when the flag is '1' and waits for the next data without restoring the data when it is '0'. Thus, it is possible to store only data that has a desired keyword.
